

## Firewall Support

We support firewalls from many vendors. The vendors include WatchGuard, Sonicwall, Linksys, and Cisco PIX. We will configure your firewall to keep your data as safe as possible. After configuring your firewall we can also run penetration tests to confirm the firewall is working as expected.

Every network/PC connected to the internet today requires a firewall for your safety. While the internet is a great way to share information, it is also full of people trying to make a quick buck. These people are after your information. How would your business function if someone was able to access your files? We can help make sure your data is as secure as possible.

A good firewall will help secure your network in many ways. We prefer firewalls that include proxies to filter http and smtp traffic. These proxy filters are better anti-virus and malware protection than the best anti-virus software. The best firewall we have seen and used to date is from WatchGuard. WatchGuard offers software that can scan http requests and email before entering your network.

To see an example of how these firewalls can stop malware from being installed on your workstation(s) check out these videos from WatchGuard. There are 3 videos - Botnets Part 1 , Malware Analysis: Botnets, Part 2 , and Malware Analysis: Botnets, Part 3 .

For more information on how you can protect your workstations, servers, and data feel free to send an email or call us at 888-740-9193.
