

Network and Server Monitoring.

Proactive.

We monitor the network and servers on our client networks. This allows us to be notified of issues as early as possible, many times without the client even being aware of problems. Our staff are notified by text messages whenever an alarm is set off on your network. Most issues are resolved before your employees arrive at work.

Monitoring also allows for trending on such items as disk space, CPU usage, and network traffic. We are then able to estimate your network requirements for future growth.
